

Micropigmentation Lash Enhancement Aftercare

What To Expect & What Comes Next

- For two to five days after the treatment, the procedure area may experience the following symptoms: Flaking, tenderness, dryness and itching, swelling, redness, eyelashes may stick together and eyelids may appear red and puffy after any eye procedures.
- Some clients have reported that taking an antihistamine helps with the swelling.
- If you require any pain relief then if you usually take paracetamol this ok to take but please avoid ibuprofen.
- If the area scabs or flakes at all please do not pick at it as you may lose pigment from areas if you do this.
- You will not see how well the skin has retained the pigment until the area is fully healed at 4 weeks.
- The top up can not be performed before the 4 weeks as the skin needs to have the time to heal first.
- The top up must be completed within 4-12 weeks after the initial treatment for optimum results or there may be an additional charge incurred.
- We normally expect 60-70% retention of colour from the 1st session as the body naturally tries to reject some of it. Everyone's skin heals differently so the outcome will vary from person to person.
- You will go through the same healing process following the 2nd session.
- I like to see you between 4-8 weeks after the 2nd session for a check up, to take a final healed photo and also carry out any very small adjustments up to 30 minutes. This is free of charge.
- Oilier skins, some medications, lifestyles and some skin types may not retain colour well so may require additional top up sessions at a charge of £60.

General Post Procedure Info

- You can not give blood for 6 months following this treatment.
- Do not have Botox, fillers or chemical peel treatments for at least 4 weeks after the eyes have healed including additional top ups.
- Please do not use AHA, Retinol, Glycolic or Hyaluronic acid on the pigment areas as it can change or fade the colour over time.

Aftercare Process

From immediately after the treatment for at least 5-7 days or until the area appears to be healed include the following in your daily routine:

- Pat the area dry with a clean damp cotton pad if you see any clear fluid.
- Please wait to shower until the following morning.
- If the area gets wet, pat dry very gently with a clean towel or tissue. Kitchen roll is a good option as it does not contain any loose fibres.
- Do not wear eye make up for at least 7 days. When you do wear mascara again it is advisable to use a new one to prevent infection.
- Do not use any cleansers or creams on the area for at least 7 days.
- Do not expose the eyes to steam, please take showers or baths a little cooler than you may usually.
- No direct sun, swimming, saunas, sunbeds or sweaty gym sessions for at least a week. Please use a sweatband following this.
- It is advised not to use any after care treatments on the eyes. However, a saline solution may be used to bathe the eyes if they are feeling tight or sore.

- Do not pick, scratch or rub the area or the colour will heal unevenly or cause scarring and infection.

Please Note:

- The colour will be 50% darker straight after the treatment. It will fade after 4 to 7 days and the true colour will not be visible until the area has completely healed and a time of up to 4 weeks has passed.
- In order to keep your permanent make up in perfect condition it may be necessary to have a follow up/retouch appointment every 12 to 14 months, but this will vary with each individual.
- If you are planning an MRI Scan, Chemical Peel or any similar procedures, please inform your practitioner that you have had permanent cosmetics.

*The area may feel tender for a few days after the procedure
