

Microblading Aftercare process

From immediately after the treatment for approx. 10—14 days:

- ONE SINGLE APPLICATION of Cavilon barrier cream has been applied on and slightly around the completed brows. This single application will last for 3 to 4 days, leaving a soft film over the brows
- Avoid showering until the following morning. You can get the area a little wet when washing and showering but try to keep the brows as dry as possible
- After any wetness, gently hold a clean tissue on the scab to dry it out, avoid rubbing the areas
- Do not use any creams, face washes or scrubs, make up removers, make up or products on the brows. Please use a small brush to carefully apply face make up around the brows
- Try not to sleep on your face and alternate sides to prevent too much friction
- Do not attempt to remove any dryness or scabs before it naturally heals away from the treated area, this might be held in eyebrow hair until gently removed with a spoolie
- At no time can you pick off attached scabs, you will cause unwanted results
- Do not apply any make up to the brow area until fully healed
- Do not expose the brows to direct sun, saunas, sunbeds, steams.

Microblading Aftercare—What to expect & what comes next

- The brows will be slightly red following the treatment and the colour will appear darker and crisper. Do not apply any make up to the forehead area until tomorrow
- The brows will feel tight and tender for a few days, a little like sun burn, this varies for everyone
- The colour will look 30-40% darker over the 10—14 days as the brows start to heal, they will begin to dry up, scab, itch and flake as the healing process takes place
- The brows will look patchy and lighten up in colour as they heal, you will not see the true colour or how well your skin has retained the pigment until 4 weeks after the initial treatment
- You may notice that once the dryness and scabbing has gone, that the colour and hair strokes seem have disappeared or look very faded, the skin may have an opaque milky appearance, this is very common and is just the new tissue healing over the top of the pigment so it obscures it for a while
- The top up cannot be performed before 8 weeks as the skin has to have time to heal and we don't want to cause any scarring.
- The top up must be completed within 8—12 weeks after the initial treatment or annual colour boost charge applies
- We normally expect 60-70% retention of the colour from the 1st session as the body naturally tries to reject some of it. Everyone's skin heals differently so the outcome will vary from person to person
- At the 2nd top up session we can adjust the colour to ensure the brows look even. You will go through the same healing process again following this
